

## **2018-105: Enhancing seed and biomass production and drought tolerance of plains rough fescue using novel seed treatments**

**Researcher: Yuguang Bai**

**Funding: \$34,500**

**Plains rough fescue is ideal for late season grazing, and it is a native species grass. However, the seed production of these plants are low, which makes planting them unaffordable. This research investigates methods to have better seed yield and biomass production.**
